

Customer Churn Analytics Report

Subscription cancellations, retention metrics, revenue impact & behavioral drivers

Dataset: customer_churn_sample.csv **Records:** 15 customers

Executive Summary

The sample contains **15** customers, of whom **7** churned. The baseline churn rate is **46.7%**, leaving a retention rate of **53.3%**. Current monthly recurring revenue (MRR) represented in the dataset is **\$1,269.85**, with **\$409.93** of monthly revenue associated with churned customers (32.3% of MRR).

KPI	Result
Customers	15
Churned customers	7
Baseline churn rate	46.7%
Retention rate	53.3%
MRR	\$1,269.85
MRR loss from churn	\$409.93 (32.3%)
Average observed CLV	\$2,088.48

Methodology & CLV Definition

Data quality checks found no missing values and no duplicate rows. For this small sample, observed CLV is estimated as **Monthly Charges × Tenure in Months** for each customer, then summarized across customers. This is an observed-value proxy rather than a predictive CLV model; it does not assume future retention or discount future cash flows.

Key Churn Drivers

Contract type: all 7 month-to-month customers churned (100%), while none of the 4 one-year or 4 two-year customers churned. This is the strongest segmentation signal in this sample, although the group sizes are very small.

Tenure: all 4 customers with 0–6 months tenure churned, and both customers in the 7–12 month group churned. Only 1 of 5 customers in the 13–24 month group churned, and no customers with more than 24 months tenure churned.

Support activity: churned customers averaged **4.3** support tickets versus **1.0** for retained customers. This association suggests support experience is worth investigating as an early-warning indicator.

Payment method: UPI customers had a 75% churn rate, Debit Card customers 100%, Credit Card customers 33.3%, and Bank Transfer customers 0% in this sample. These results should be treated cautiously because several payment groups contain only 2–4 customers.

Contract & Tenure Analysis

Revenue & Customer Value

Average observed CLV is **\$2,088.48**. Retained customers average **\$3,527.21** in observed CLV versus **\$444.22** among churned customers. The difference is largely consistent with the shorter tenure of churned customers.

Behavioral Relationships

Actionable Recommendations

- 1. **Strengthen the first 12 months:** create onboarding checkpoints, usage education, and proactive outreach because early-tenure customers show the highest churn in this sample.
- 2. **Convert month-to-month customers:** test annual-contract incentives, loyalty benefits, or renewal reminders while monitoring whether incentives improve retention without eroding margin.
- 3. **Use support tickets as a risk signal:** flag customers with repeated support interactions for proactive service recovery and issue-resolution follow-up.
- 4. **Investigate payment friction:** review failed payments, payment UX, and customer preferences by payment method before changing payment policies.
- 5. **Expand the dataset:** validate these patterns on a larger historical customer population and test statistical significance before making major pricing or retention decisions.

Important Limitation

This dataset has only 15 customers. The 100% churn rates for some segments can be caused by very small sample sizes, so the results are directional rather than statistically generalizable. A larger dataset should be used for production decisions and predictive modeling.
